Why Cabral Gold?

Management

CEO has so far invested C\$2M cash. Management is credited with 5 grass-roots gold discoveries in Brazil with 43-101 compliant resources totaling +5Moz, including the nearby Tocantinzinho open pit gold mine and the Coringa underground mine. Sold last company to Anfield which is now part of Equinox Gold

Location / District Scale

The Cuiú Cuiú project is located within the Tapajos Gold Province in northern Brazil **adjacent to GMining's Tocantinzinho gold mine** (commissioned in September 2024) which is Brazil's third largest open pit gold mine. According to the ANM (Mining Agency of Brazil), Cuiú Cuiú historically produced 10x more placer gold than Tocantinzinho

Fully Funded Starter Operation under Construction

US\$45M gold loan to fund construction of Stage 1 starter operation closed November 2025. Phase 1 will target near surface gold-in-oxide material. July 2025 PFS resulted in capex of US\$37.7M and after-tax IRR of 78% and NPV₅ of \$74M at \$2500/oz base case. All-in sustaining costs of US\$1,210 per oz and initial production of 25,000oz / year. Stage 1 cash flow will allow self-funded drilling and expansion of the global resource base within the district, which will lead to PEA on much larger hard rock resource (Stage 2). LP for Full Mining License Granted (March 2026). **Construction of Phase 1 mine is 85% complete (July 2026). First gold pour expected Q4 2026**

Tapajós Gold Province

Site of world's largest gold rush and an emerging world-class gold district

Largest Producer of Placer Gold

Cabral's Cuiú Cuiú project was the largest producer of placer gold during the Tapajós gold rush from 1978 to 1995, which is the largest gold rush ever recorded during which 30Moz* was recovered

Located Within the Tapajós Gold Province

Project is located within the Tapajós Gold Province which includes several existing gold mines and deposits including the Tocantinzinho gold mine of GMining Ventures which was commissioned on 3 September 2024 and is the third largest gold mine in Brazil

Trending TZ Fault Zone

Known deposits (5) in the Tapajós are all controlled by the major NW trending TZ fault zone. Anglo American and Nexa also have extensive claims

Proximity of Cuiú Cuiú to Tocantinzinho

Similarities

- Cuiú Cuiú is located adjacent to GMining's Tocantinzinho gold mine. Both projects are located on the Tocantinzinho lineament, and are intrusive hosted, disseminated gold deposits with the same mineralogy and metallurgy
- Cuiú Cuiú produced 2Moz of placer gold or **10x the amount** that Tocantinzinho produced, i.e. 0.2Moz*

Differences

- Multiple deposits (6) and targets (+50) occur within an area of 10 x 15km at Cuiú Cuiú
- Eldorado's best drill result outside Tocantinzinho over 11 years was 20m @ 1.73 g/t gold. GMining's best intercept outside Tocantinzinho is 10m @ 1.1 g/t gold
- The known deposits at Cuiú Cuiú at Central and MG, as well as recent hardrock discoveries at PDM, Machichie Main, Jerimum Cima and Machichie NE, all contain **very high-grade zones e.g. 11m @ 33g/t gold, 9.5m @ 87.4 g/t gold**

Strategy

- Because Cuiú Cuiú is a large district with many targets, Cabral is pursuing a 2-stage development strategy. The initial stage 1 is under construction and will mine 3000t/d of near surface saprolite resulting in an initial ~25,000oz/yr
- The cash flow from Stage 1 will be used to fund
 1. Expansion of Stage 1 Production
 2. Exploration drilling program to grow the larger global hard rock resources
 3. A PEA on the larger Stage 2 mine is planned for 2027

Regional Potential

Targets Outside Existing Deposits

Alonso target; an example

High-grade boulders on surface, unexplained source

- Target located 3km SE of MG, with 24 samples of quartz vein float returning values from 11.6 to 200.3 g/t gold (av. 91.7 g/t gold) on surface
- Quartz vein boulders extend over at least 950m strike length west of initial occurrence. Highly anomalous gold in streams extend up to 1.5km
- Major E-W trending mag feature. Source of the boulders currently unknown

Initial Stage 1 Heap Leach Operation Under Construction

District requires significant Investment

District-scale of Cuiú Cuiú and large number of targets that require further drilling means that significant drilling will be required to determine size of global resource. Management believes that continued reliance on raising capital through dilution to the capital structure is not the optimal approach to funding this work

Near-Term Cash Flow Opportunity

An opportunity exists for near-term cash flow by achieving gold production from the mining and processing of near-surface gold-in-oxide resources which are up to 60m in thickness and occur above all of the primary gold deposits and new discoveries. This gold-in-oxide material consists of soil / blanket sediments and saprolite and has resulted from weathering of the underlying primary gold deposits

Strategic Goal: To Avoid Dilutive Financing for Resource Expansion

The objective is to eliminate the need for expensive and dilutive equity financings to fund additional drilling aimed at significantly expanding global resource base to +2Moz (both hard rock and oxide material), and a stage 2 PEA on the much larger hard rock resource

Updated PFS for Stage 1 Operation – led by Ausenco Brazil

Released July 29, 2025 – After-tax IRR of 78%. NPV5 of US\$73.9 million at gold price of \$2,500 / oz. Capex of US\$37.7 million, payback 10 months, Life of Mine EBITDA of US\$154.4 million, Life of Mine gold production of 113,155oz and AISC of US\$1,210 / oz

Phase 1 Mine under Construction

Project financing closed (November 26, 2025) US\$45M gold loan is fully funding Stage 1 Starter Operation. Construction 85% complete as of July 2026. Currently on schedule. Commissioning in progress. First gold pour expected Q4 2026.

MG Gold-in-Oxide Material

Near-surface, Focus of Starter operation

- MG is largest of five gold-in-oxide zones identified to date (MG, Central, Machichie, PDM and J Cima). Results within the MG oxide material include **60m @ 3.5 g/t gold**
- Oxide Indicated Resources at MG of 8.86Mt @ 0.5 g/t (135,855oz) and Inferred Resources of 3.14Mt @ 0.2 g/t (22,508oz). Significant amount of higher grade material (+1.75g/t gold)
- Heap leach metallurgical tests returned 92-93% gold recoveries— material is free digging (no drilling or blasting required) and is amenable to heap leach processing

Gold-In-Oxide Resources & Reserves

Gold-in-oxide blankets

Five gold-in-oxide blankets identified at Central, MG, PDM, Machichie and, most recently Jerimum Cima, have so far been identified within the Cuiu Cuiu district

Resources identified

Resources thus far identified (only within the near surface gold-in-oxide) amount to Indicated resources of 216,182oz and Inferred resources of 70,569oz

Gold-in-oxide material

Gold-in-oxide material consists of soils and sediments and underlying weathered bedrock (saprolite) and is within 60m of surface (very low strip ratio). The material is free digging (no drilling and blasting) and will not require crushing or grinding

Initial starter mining and processing operation

The PFS only contemplates an initial starter mining and processing operation of 128,903oz of gold-in-oxide in Probable Reserves at MG, Central and Machichie. PDM and Jerimum Cima were not included due to insufficient drill density
